Methodology:

- daemon restart between tests (apache2, mysql, memcached)
- page refresh ("Recent posts" page, tracker2), followed by multiple visits - average results taken
- login session in firefox, anonymous session in chrome
- login session not user 1, but full administrator nonetheless

Daemon settings:

- APC on (1x256MB, standby)
- Memcached on (128MB, standby)

Drupal settings:

- Block cache on
- Page compression on
- CSS and JavaScript aggregation on
- CSS compression on (CSS Gzip)
- JavaScript compression on and minify on (JavaScript Aggregator)
- Devel on (collect query, display timer, display memory)
- Tracker 2 on

Conclusions:

- For maximum performance, APC should be turned on by default (global) for the virtual host.
- While not compared in these benchmarks, having AuthCache enabled makes a huge difference for authenticated users.
- Having file-based caching (CacheRouter, Boost+) can save a lot of memory, but its performance can be hampered by I/O.
- Memcache based caching (Memcache API) is also equally effective, spending about the same resources.
- Do not use Memcache with CacheRouter - the module performs very poorly with that caching backend.
- Avoid using APC turned on by default (global) in conjunction with APC enabled on Drupal (CacheRouter, APC).

The three best configurations for a single server are as follows:

- APC + CacheRouter (file+apc) + AuthCache: high performance; not scalable; lower memory consumption
- APC + CacheRouter (file) + AuthCache: high performance; not scalable; lower memory consumption; hampered in I/O
- APC + Memcache API + AuthCache: best performance, scalable; higher memory consumption
