

Debugging PHP: Using Komodo IDE with XDebug

Rob Thorne
Torenware Networks

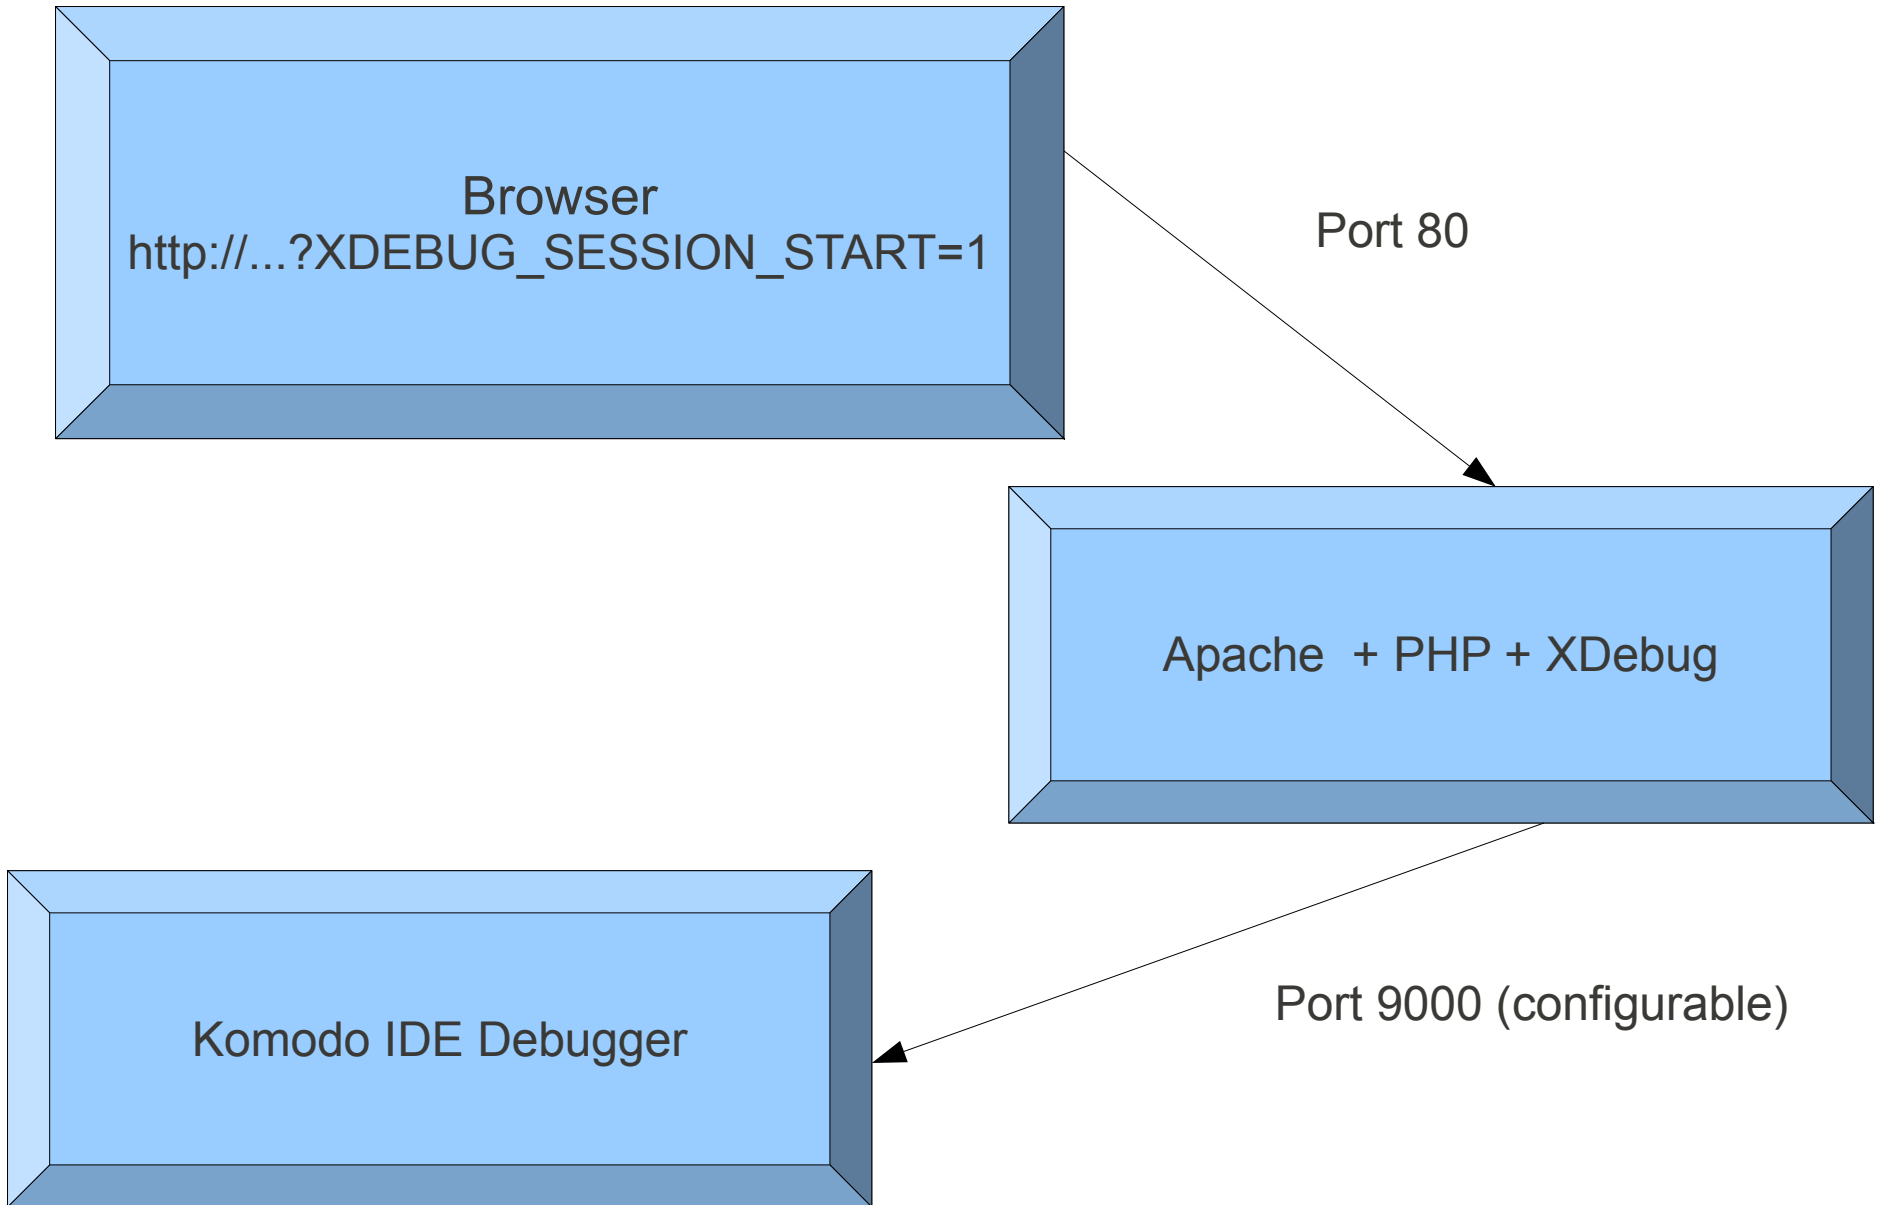

Why?

- Understand someone else's software.
- Understand your own software.
- Fix weird and wonderful bugs.
- Save **loads** of time.

How?

- Download or purchase Komodo at <http://www.activestate.com/>
- Set up Apache with Xdebug support.
 - Hopefully your distribution has this (or download for Windows).
 - Or: build it.
- Set the port under Prefs / Debug
- PROFIT!!!!

`/etc/php5/apache2/php.ini` (Location for Debian)

[xdebug]

```
;; RMT standard stuff for Komodo or PHPEclipse  
;; Your xdebug executable may be listed in /etc/php5/conf.d/  
;; If not, you can add it here:  
zend_extension=/usr/lib/php5/20060613+libs/xdebug.so
```

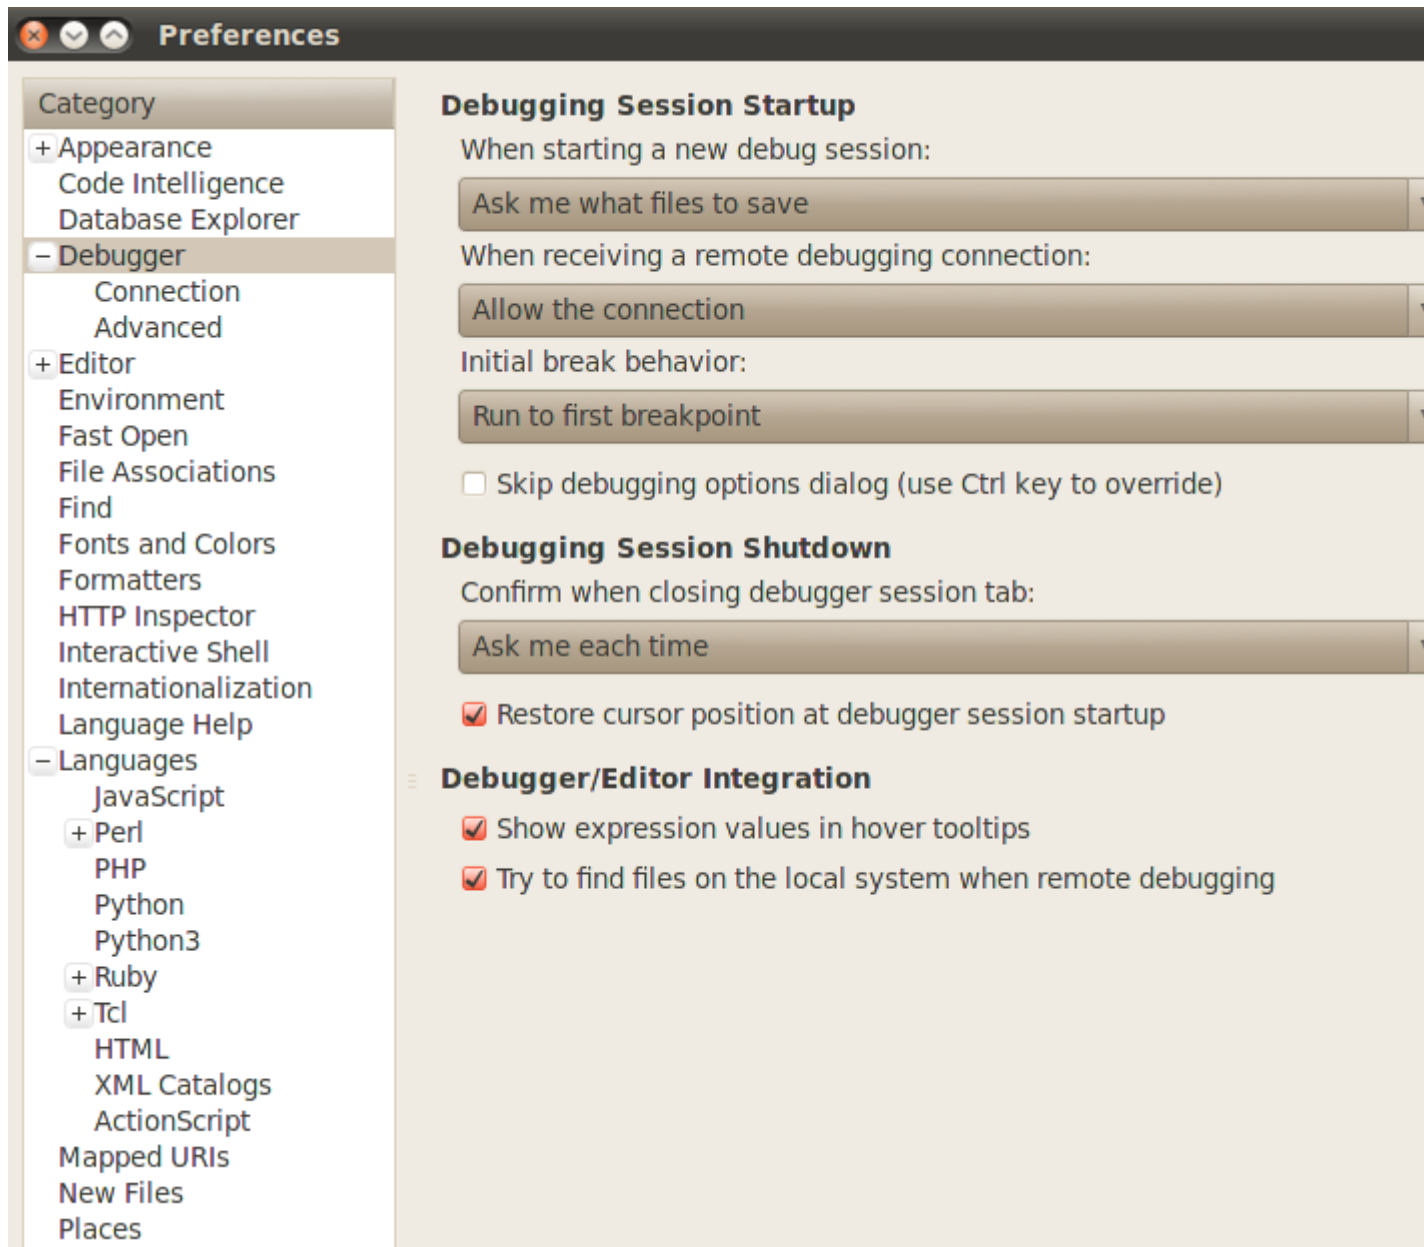

```
xdebug.remote_enable=1  
xdebug.remote_handler=dbgp  
xdebug.remote_mode=req  
xdebug.remote_host=127.0.0.1  
xdebug.remote_port=9000
```

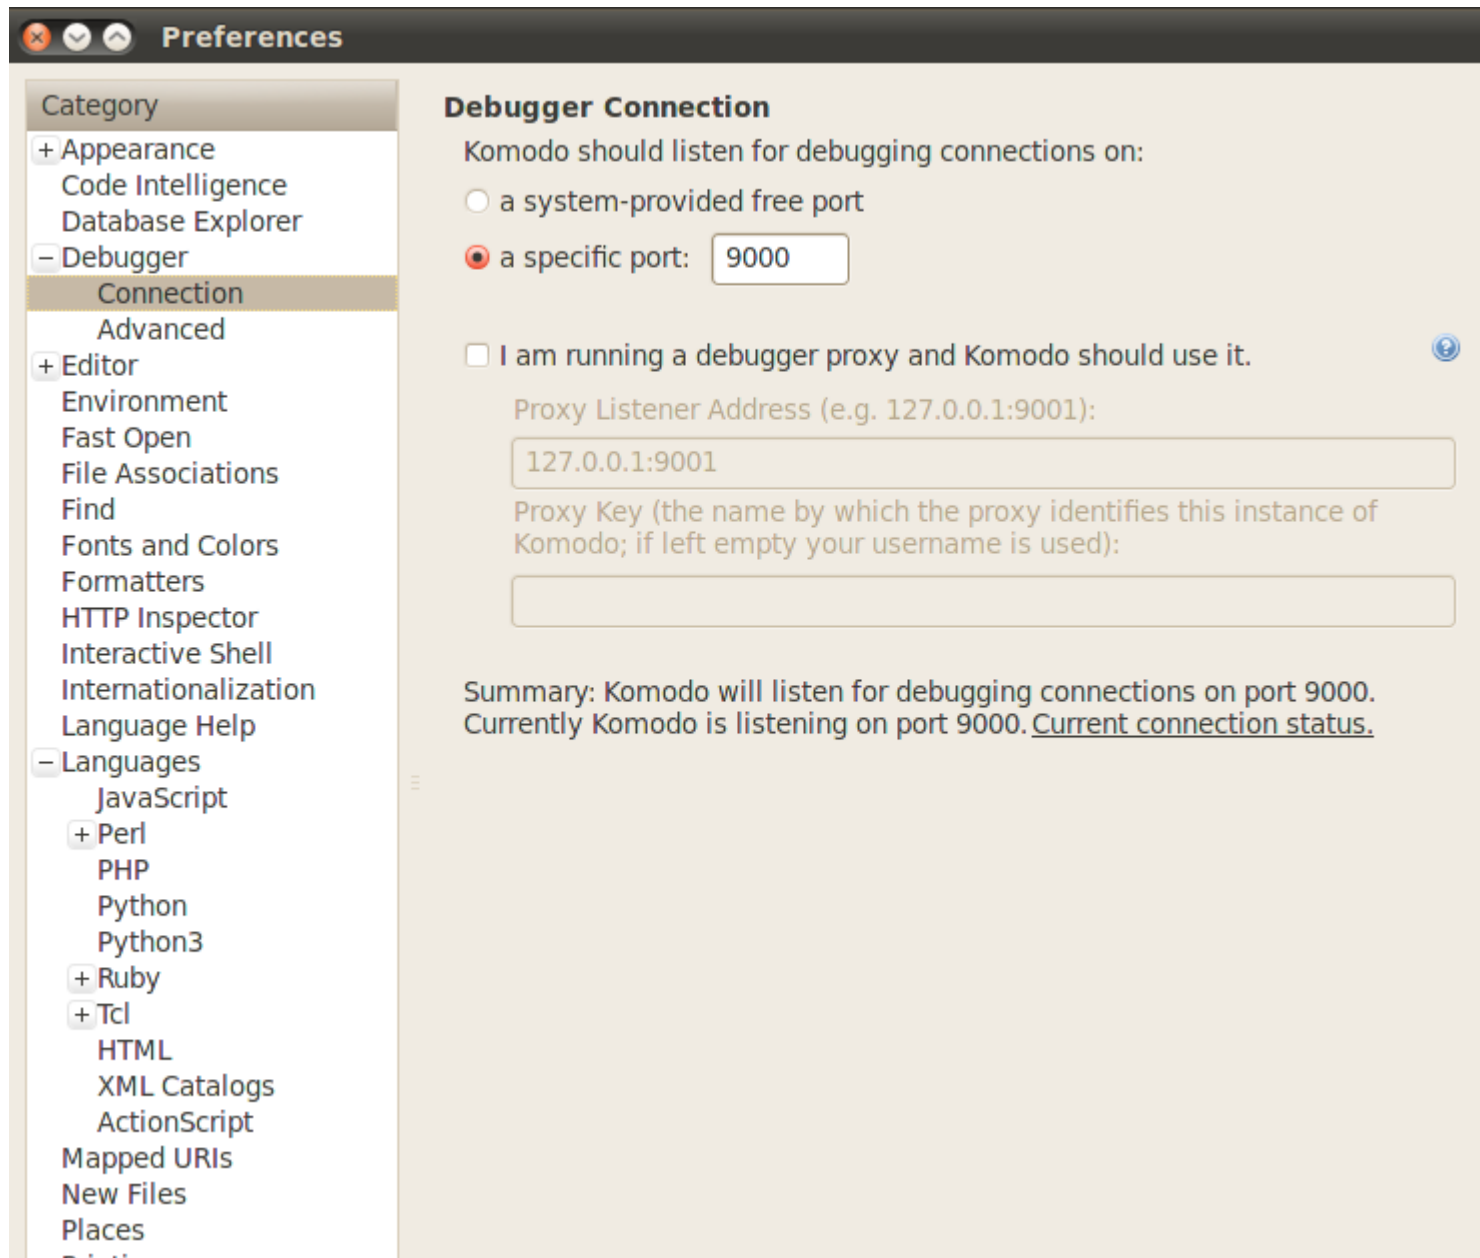

Useful Stuff

- easy Xdebug (<https://addons.mozilla.org/en-us/firefox/addon/easy-xdebug/>)

Get Komodo Set Up

- Create a new project that includes your document root directory in Apache
- Turn on PHP debugging in Edit / Preferences.
- Set up *.module and similar Drupal prefixes as PHP files.
- Consider installing “easy xDebug” in your browser, and...
- Debug away.

Debugging PHP Scripts (Drush)

```
#!/bin/bash
export XDEBUG_CONFIG="remote_port=9000 remote_enable=1"
DRUP_INSTALL=/home/rtoren/Torenware/Website/tfcnew/docs
DRUSH=/home/rtoren/drush
php $DRUSH/drush/drush.php -l https://test -r $DRUP_INSTALL $@
```
