

File structure: chanda is the site migrated from webenabled in Drupal class.
This is the site I built the views on. I would like to be able to export the views from this site but I can't access it.

The site is not listed in the Drupal Control panel. When I try and pull up the site by typing in the address <http://chanda.localhost:8082/> I get the default site <http://localhost:8082>.

The database for the site is still there:

The screenshot shows the phpMyAdmin web interface in a browser. The address bar indicates the URL is localhost:8082/phpmyadmin/. The interface includes a sidebar on the left with the phpMyAdmin logo and a list of databases. The main content area displays a table of databases with checkboxes for selection. At the bottom, there are links for 'Check All / Uncheck All' and 'Enable Statistics'.

localhost:8082/phpmyadmin/
